| Date                             | December 31, 2020                                     |

# Introduction

This report is the second progress report on the FIP being conducted by the Fukuichi Fishery, following the first report published in June 2020. The original pre-assessment was conducted in 2018-2019 for yellowfin and albacore in the Pacific Ocean, conducted by MRAG. An additional pre-assessment was conducted for Pacific bigeye tuna in November 2019, by the Japan Fisheries Certification Support. The results of the pre-assessment revealed that little information was available for non-target species in the fishery, and therefore all PIs, except PI 2.3.2, of the components achieved less than 60 points. In the Action Plan of this FIP, it was most prioritized to improve performance on nontarget species which are covered by MSC components of 2.1, 2.2 and 2.3, which were planned to improve in the first year. The original Action Plan and the progress is shown in the Table 6. Issues related to Principle 1 and 3 and habitat and ecosystem in Principle 2 are going to be improved in the 2<sup>nd</sup> year. Therefore, this report only focuses on Principle 2 species PIs (PI 2.1.1 – 2.3.3), and rescored those PIs according to improvement done so far.

## 2 Executive summary

This assessment was conducted by Makoto Suzuki, Japan Fisheries Certification Support, on behalf of Fukuichi Fishery Co., Ltd. Suzuki is an independent consultant who is registered as an Associate Technical Consultant in the MSC website.

This report is the second progress report on the FIP being conducted by the Fukuichi Fishery, following the first report published in June 2020. The original pre-assessment was conducted in 2018-2019 for yellowfin and albacore in the Pacific Ocean, conducted by MRAG. An additional pre-assessment was conducted for Pacific bigeye tuna in November 2019, by the Japan Fisheries Certification Support. The results of the pre-assessment revealed that little information was available for non-target species in the fishery, and therefore all PIs, except PI 2.3.2, of the components achieved less than 60 points. In the Action Plan of this FIP, it was most prioritized to improve performance on nontarget species which are covered by MSC components of 2.1, 2.2 and 2.3, which were planned to improve in the first year. The original Action Plan and the progress is shown in the Table 6. Issues related to Principle 1 and 3 and habitat and ecosystem in Principle 2 are going to be improved in the 2nd year. Therefore, this report only focuses on Principle 2 species PIs (PI 2.1.1 – 2.3.3), and rescored those PIs according to improvement done so far.

The weakness of the fishery identified in the original pre-assessment and the first progress report was limited information about bycatch species and bait use. To fill the gap, the team collected logbook data from vessel owners and analysed the impact on bycatch species including sharks, sea birds and turtles. The team also requested observer record to Fisheries Agency and the necessary data will be provided in earlier 2021. Observer record will support the logbook data as a fishery independent source.

According to those activities, some PIs, including PI 2.1.1 – 2.1.3, changed red to green, but some PIs are still red. It is recommended to get the observer record and information about the bait fishery in China and Vietnam, to meet the sustainability level that the MSC standard requires.

### 3 Version details

**Table 1 – Fisheries program documents versions**

| Document                               | Version number       |

| Client group  | Fukuichi Fishery Co., Ltd        |
| Other eligible fishers                                | None                             |
| Geographical area                                     | FAO71                            |
| Justification for choosing the Unit of Assessment     | WCPFC                            |
| UoA 3   | Description                      |
| Species   | Albacore tuna (Thunnus alalunga) |
| Stock   | South Pacific albacore           |
| Fishing gear type(s) and, if relevant, vessel type(s) | Pelagic longline                 |
| Client group  | Fukuichi Fishery Co., Ltd        |
| Other eligible fishers                                | None                             |
| Geographical area                                     | FAO 71                           |
| Justification for choosing the Unit of Assessment     | WCPFC                            |
| UoA 4   | Description                      |
| Species   | Bigeye tuna(Thunnus obesus)      |

|   |                           |
|---|---------------------------|
| Stock   | Western Pacific bigeye    |
| Fishing gear type(s) and, if relevant, vessel type(s) | Pelagic longline          |
| Client group  | Fukuichi Fishery Co., Ltd |
| Other eligible fishers                                | None                      |
| Geographical area                                     | FAO71                     |
| Justification for choosing the Unit of Assessment     | WCPFC                     |

## 5 Assessment results

### 5.1 Assessment results overview and recommendations

PIs were re-scored based on Table 5. It was found that there was no main Primary species for this fishery, and 2.1.1 through 2.1.3 were all above 80 points. Both 2.2 and 2.3 components are likely to be below 80 points, because of some inaccuracy in logbook records bycatch of sharks, sea turtles, and seabirds, as well as lack of information about bait imported from China and Vietnam. In order to improve scores, it is recommended that the accuracy of bycatch records and information on baitfish fisheries should be improved.

### 5.2 Summary of potential conditions by Principle

**Table 3 – Summary of Performance Indicator level scores**

| Principle of the Fisheries Standard                   | Number of PIs with draft scoring ranges <60 |
|---|---|
| <b>Principle 1 – Stock status</b>                     | <b>N/A</b>                                  |
| <b>Principle 2 – Minimising environmental impacts</b> | <b>6</b>                                    |
| <b>Principle 3 – Effective management</b>             | <b>N/A</b>                                  |

### 5.3 Summary of Performance Indicator level scores

**Table 4 – Summary of Performance Indicator level scores**

| 2.1.1 – Primary Outcome                                      | Draft scoring range | Data deficient? |
|--|---------------------|-----------------|
| Rationale or key points                                      | <b>≥80</b>          | <b>Yes / No</b> |
| There is no main primary species identified in this fishery. |                     |                 |
| <b>2.1.2 – Primary Management</b>                            |                     |                 |

|   |         |          |
|---|---------|----------|
| Rationale or key points   | ≥80     | Yes / No |
| There is no main primary species identified in this fishery.  |         |          |
| <b>2.1.3 – Primary Information</b>  |         |          |
| Rationale or key points   | ≥80     | Yes / No |
| There is no main primary species identified in this fishery.  |         |          |
| <b>2.2.1 – Secondary Outcome</b>  |         |          |
| Rationale or key points   | 60 – 79 | Yes / No |
| <p><u>Sandbar shark</u><br/>All sharks, including Sandbar shark, are released. Therefore SG60 should be met. However due to some inaccuracy in the logbook and unknown post-release mortality, SG 80 is not considered to be met.</p> <p><u>Bait fish</u><br/>Shortfin scad and Smoothbelly sardinella are used as bait, as well as other species identified as minor secondary species. RBF should be used to assess this PI in the Full assessment, but considering IUCN is rating as “Least Concern” and high productivity of those species, at least SG 60 is considered met. More information should be collected to gain higher scores.</p> |         |          |
| <b>2.2.2 – Secondary Management</b>   |         |          |
| Rationale or key points   | <60     | Yes / No |
| <p><u>Sandbar shark</u><br/>There is general understanding at international and national level that sharks should be protected, and the fishery releases all sharks. At least SG 60 should be met.</p> <p><u>Bait fish</u><br/>There is limited information about Chinese and Vietnamese fisheries which target Shortfin scad and Smoothbelly sardinella that are used as bait in the fishery. SG 60 cannot be met.</p>   |         |          |
| <b>2.2.3 – Secondary Information</b>  |         |          |
| Rationale or key points   | <60     | Yes / No |
| <p><u>Sandbar shark</u><br/>Impact of Japanese longline fishery against sharks are summarized in the Annual Report for WCPFC but there is not species-specific information about Sandbar shark. Logbook data have some inaccuracy and post-release mortality is not known. Therefore SG 60 is not met.</p> <p><u>Bait fish</u><br/>There is limited information about Chinese and Vietnamese fisheries which target Shortin scad and Smoothbelly sardinella that are used as bait in the fishery. SG 60 cannot be met.</p>  |         |          |
| <b>2.3.1 – ETP Outcome</b>  |         |          |
| Rationale or key points   | 60 – 79 | Yes / No |
| All sharks, including Silky sharks and Oceanic Whitetip sharks, are released. Interaction with sea turtles and sea birds are limited for this fishery, according to Japan’s Annual Reports for WCPFC. Therefore, at least the SG 60 is  |         |          |

considered met. However, due to lack of accurate logbook data and/or independent observer data, SG 80 cannot be met.

### 2.3.2 – ETP Management

Rationale or key points

60 – 79

Yes / No

Some measures, which are required at SG 60, are available to mitigate sharks, sea birds and sea turtles. However, because of lack of independent observer data or other reliable data, SG 80 cannot be met.

### 2.3.3 – ETP Information

Rationale or key points

<60

Yes / No

ETP species are recorded in logbook and observed within the observer program. However, there is some inaccuracy in fishermen's logbook and independent observer data is not currently available. Therefore, this does not meet information adequacy which the SG 60 requires.

## 5.4 Principle 2

### 5.4.1 Principle 2 background

In the MSC assessment, any species other than the target species are classified as "Primary species," "Secondary species," or "ETP species." Also, depending on whether it exceeds 5% of the total weight (2% for less resilient species), the species are classified as "major" or "minor" and reviewed separately. These species were not identified at the time of the initial pre-assessment, and the importance of categorization was recognized in the project.

Table 5 was created based on fishermen's logbooks, landings data at fishing ports, and bait data provided by vessel owners. This table was updated for this report, according to a change of UoA and some information we collected on on-board practice of handling sharks and bait species. Based on this Table, PI2.1.1 through PI2.3.3 were scored. The weight of the released fish species was calculated based on the "Summary of longline fishery bycatch at a regional scale, 2003-2017" (WCPFC-SC14-2018/ST-WP-03 Rev. 2 (13 August 2018)).

**Table 5 Summary of species interacted by the UoA**

| Common name                          | Science name               | Total (kg, %) |             | Retained (kg, %) | Released/discarded (kg, %) | MSC P2 categories    |             |
|--------------------------------------|----------------------------|---------------|-------------|------------------|----------------------------|----------------------|-------------|
| Pacific Bluefin tuna                 | Thunnus orientalis         | 200           | 0.0%        | 200              | 0                          | Primary              | Minor       |
| Southern Bluefin tuna                | Thunnus maccoyii           | 0             | 0.0%        | 0                | 0                          | Primary              | Minor       |
| Albacore tuna                        | Thunnus alalunga           | 245,485       | 14.8%       | 244,214          | 1,271                      | Target               |             |
| Bigeye tuna                          | Thunnus obesus             | 140,980       | 8.5%        | 140,085          | 895                        | Target               |             |
| Yellowfin tuna                       | Thunnus albacares          | 662,580       | 39.9%       | 643,340          | 19,240                     | Target               |             |
| Swordfish                            | Xiphias gladius            | 18,495        | 1.1%        | 18,495           | 0                          | Secondary            | Minor       |
| Striped marlin                       | Kajikia audax              | 4,845         | 0.3%        | 4,735            | 110                        | Secondary            | Minor       |
| Indo-Pacific blue marlin             | Makaira mazara             | 56,606        | 3.4%        | 56,002           | 604                        | Secondary            | Main(?)     |

## 5.4.2 Principle 2 Performance Indicator scores and rationales

### PI 2.1.1 – Primary species outcome

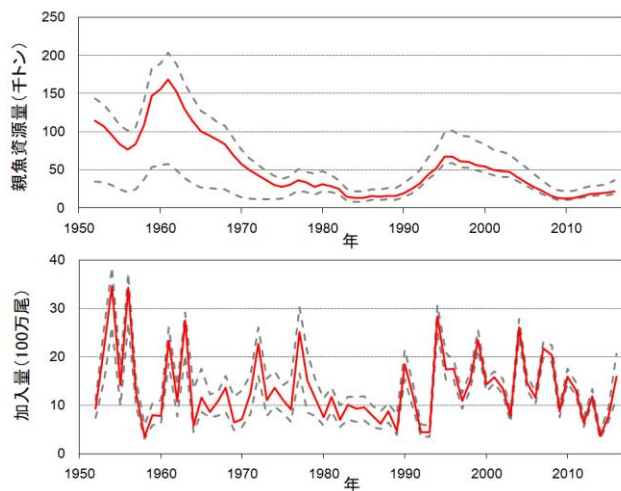

| PI 2.1.1      |                                   | The UoA aims to maintain primary species above the point where recruitment would be impaired (PRI) and does not hinder recovery of primary species if they are below the PRI  |  |  |
|---------------|-----------------------------------|---|--|--|
| Scoring Issue |                                   | SG 60   | SG 80  | SG 100   |
| <b>a</b>      | Main primary species stock status |   |  |  |
|               | Guide post                        | <p>Main primary species are <b>likely</b> to be above the PRI.</p> <p>OR</p> <p>If the species is below the PRI, the UoA has measures in place that are <b>expected</b> to ensure that the UoA does not hinder recovery and rebuilding.</p> | <p>Main primary species are <b>highly likely</b> to be above the PRI.</p> <p>OR</p> <p>If the species is below the PRI, there is either <b>evidence of recovery</b> or a demonstrably effective strategy in place <b>between all MSC UoAs which categorise this species as main</b>, to ensure that they collectively do not hinder recovery and rebuilding.</p> | <p>There is a <b>high degree of certainty</b> that main primary species are above the PRI <b>and are</b> fluctuating around a level consistent with MSY.</p> |
|               | Met?                              | <b>Yes</b>  | <b>Yes</b>   | <b>Yes</b>   |
| Rationale     |                                   |   |  |  |

This fishery does not have Main Primary species. Therefore, score of 100 is given to this SI.

|           |                                    |   |  |           |
|-----------|------------------------------------|---|--|-----------|
| <b>b</b>  | Minor primary species stock status |   |  |           |
|           | Guide post                         | <p>Minor primary species are highly likely to be above the PRI.</p> <p>OR</p> <p>If below the PRI, there is evidence that the UoA does not hinder the recovery and rebuilding of minor primary species.</p> |  |           |
|           | Met?                               |   |  | <b>No</b> |
| Rationale |                                    |   |  |           |

#### Pacific bluefin tuna

Pacific bluefin tuna is in a depleted state and is strictly managed. It is rare for Pacific bluefin tuna to be caught in this fishery (one fish by four vessels in 2019) and even in this case the catch is within the quota. Therefore, the fishery will not hinder recovery; it meets SG 100.

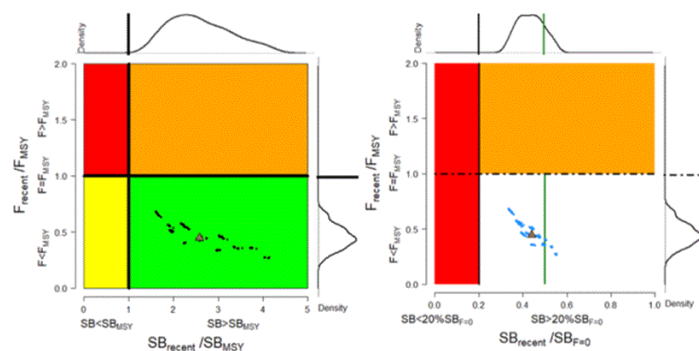

### Southern bluefin tuna

Status of Southern bluefin tuna is considered depleted ( $B = 13\% B_0$ ). However, Southern BFT is not caught in this marine area, so the UoA does not hinder recovery. SBFT can be removed from the catch list when the full assessment is conducted.

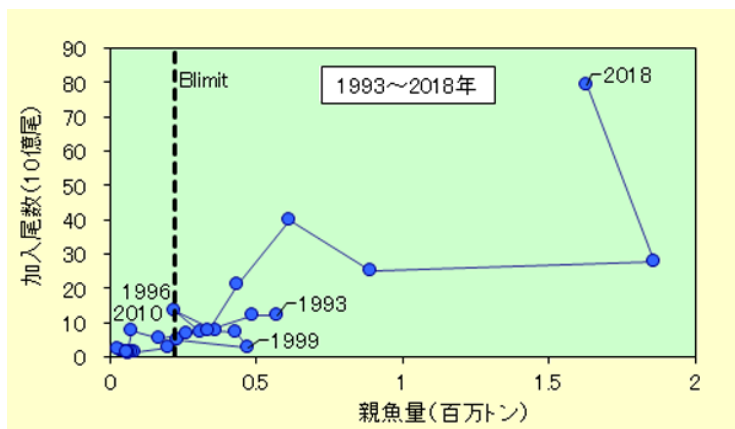

### Skipjack tuna

Stock status of Skipjack is around MSY level and highly likely to be above PRI; this meets SG 100.

### Pacific sardine

The biomass of sardines is thought to increase or decrease every few decades. Now the stock has been in increasing trend since 2011. Although the stock status is considered still below MSY level, the stock is increasing and recruitment has been successful. Therefore, the stock is higher than PRI and it cannot be said that this fishery is hindering recovery; it meets SG 100.

### Mackerel

There are 2 species and total 4 stocks of mackerel in Japan. However, details of the mackerel used as bait by the fishery are unknown; SG100 is not met.

### Japanese flying squid

There are two stocks of Japanese flying squid but it is not known which stock is used by the fishery as bait. In general, the stock status of Japanese flying squid is low, and it cannot be said there is evidence that the fishery does not hinder its recovery. SG 100 is not met.

## PI 2.1.2 – Primary species management strategy

| PI 2.1.2      |                              | There is a strategy in place that is designed to maintain or to not hinder rebuilding of primary species, and the UoA regularly reviews and implements measures, as appropriate, to minimise the mortality of unwanted catch |   |  |
|---------------|------------------------------|--|---|--|
| Scoring Issue |                              | SG 60  | SG 80   | SG 100   |
| <b>a</b>      | Management strategy in place |  |   |  |
|               | Guide post                   | There are <b>measures</b> in place for the UoA, if necessary, that are expected to maintain or to not hinder rebuilding of the main primary species at/to levels which are likely to be above the PRI.                       | There is a <b>partial strategy</b> in place for the UoA, if necessary, that is expected to maintain or to not hinder rebuilding of the main primary species at/to levels which are highly likely to be above the PRI. | There is a <b>strategy</b> in place for the UoA for managing main and minor primary species. |
|               | Met?                         | <b>Yes</b>   | <b>Yes</b>  | <b>No</b>  |
| Rationale     |                              |  |   |  |

### Main Primary species

There is no main Primary species for this fishery. Therefore, SG 80 is met.

### Skipjack tuna

Skipjack is managed by the WCPFC. However, according to the assessment results of fisheries that have been MSC certified to date, the harvest strategy for skipjack tuna does not meet SG 100. Although skipjack are a bycatch species for the fishery, there does not appear to be any specific measures in place to catch skipjack. Therefore, SG100 is not considered to be met.

### Sardine, mackerel and squid.

Sardine, mackerel and squid are managed under Japan's TAC system. However, the TAC system does not always work effectively, and some stocks are depleted. In terms of the impact of this fishery on the minor Primary species, there seems not a self-regulation not to use depleted stocks as bait. Information will need to be collected in the future to determine what criteria are used to select bait. At this time, SG 100 is not likely to be met.

|           |                                |   |   |   |
|-----------|--------------------------------|---|---|---|
| <b>b</b>  | Management strategy evaluation |   |   |   |
|           | Guide post                     | The measures are considered <b>likely</b> to work, based on plausible argument (e.g., general experience, theory or comparison with similar fisheries/species). | There is some <b>objective basis for confidence</b> that the measures/partial strategy will work, based on some information directly about the fishery and/or species involved. | <b>Testing</b> supports <b>high confidence</b> that the partial strategy/strategy will work, based on information directly about the fishery and/or species involved. |
|           | Met?                           | <b>Yes</b>  | <b>Yes</b>  | <b>No</b>   |
| Rationale |                                |   |   |   |

### Main Primary species

There is no main Primary species for this fishery.

### Bluefin tuna, skipjack tuna

Bluefin tuna and skipjack tuna are both managed by the WCPFC and their management are regularly reviewed and considered to be effective. The SG 80 is considered met.

### Sardines, mackerel, and squid

Sardines, mackerel and squid are managed by the national TAC system, but detailed information about species/stocks is not available from the bait purchase record. Stock assessment of TAC species are annually conducted and it is analysed whether the system is working effectively. Some stocks are depleted and decreasing even under TAC system, so the system does not seem to be working all the time.

At UoA level, this fishery uses only a small amount of fish as bait compared to total amount of fish caught in Japan. Particularly, price of squid is increasing because of poor stock status, so squid is not recently used by this fishery. This selection of bait may be indirectly linked to the avoidance of using depleted stocks. The SG 80 is met.

Although SG 80 is met, more information is needed to meet SG 100.

| c         | Management strategy implementation |   |            |   |
|-----------|------------------------------------|---|------------|---|
|           | Guide post                         | There is <b>some evidence</b> that the measures/partial strategy is being <b>implemented successfully</b> . |            | There is <b>clear evidence</b> that the partial strategy/strategy is being <b>implemented successfully and is achieving its overall objective as set out in scoring issue (a)</b> . |
|           | Met?                               |   | <b>Yes</b> | <b>No</b>   |
| Rationale |                                    |   |            |   |

Same as (b), the score of 80 is given to this SI.

| d         | Shark finning |   |  |  |
|-----------|---------------|---|--|--|
|           | Guide post    | It is <b>likely</b> that shark finning is not taking place. | It is <b>highly likely</b> that shark finning is not taking place. | There is a <b>high degree of certainty</b> that shark finning is not taking place. |
|           | Met?          | <b>NA</b>   | <b>NA</b>  | <b>NA</b>  |
| Rationale |               |   |  |  |

No shark species interacted by this fishery is classified as Primary species. Therefore, this SI is not scored.

| e         | Review of alternative measures |  |   |   |
|-----------|--------------------------------|--|---|---|
|           | Guide post                     | There is a review of the potential effectiveness and practicality of alternative measures to minimise UoA-related mortality of unwanted catch of main primary species. | There is a <b>regular</b> review of the potential effectiveness and practicality of alternative measures to minimise UoA-related mortality of unwanted catch of main primary species and they are implemented as appropriate. | There is a <b>biennial</b> review of the potential effectiveness and practicality of alternative measures to minimise UoA-related mortality of unwanted catch of all primary species, and they are implemented, as appropriate. |
|           | Met?                           | <b>NA</b>  | <b>NA</b>   | <b>NA</b>   |
| Rationale |                                |  |   |   |

There is no main Primary species. Pacific bluefin tuna and skipjack tuna are classified as minor Primary species, but they are all retained and not considered as “unwanted catch”, Therefore, this SI is not scored.

| <b>b</b>  | Information adequacy for assessment of impact on minor primary species |  |  |  |
|           | Guide post   | Some quantitative information is adequate to estimate the impact of the UoA on minor primary species with respect to status. |  |  |
|           | Met?   |  |  | <b>Tuna: Yes</b><br><b>Bait fish: No</b> |
| Rationale |  |  |  |  |

### Tuna

Pacific bluefin tuna and skipjack tuna are classified as minor Primary species. Stock assessment is conducted regularly by scientific authorities and fishery dependent and independent information is collected to support the stock assessment. Therefore the SG 100 is met.

### Baitfish

Sardine, mackerel and Japanese flying squid are managed by TAC and stock assessment is conducted annually to determine TAC. Various information is collected to conduct the stock assessment. However, details of stocks of bait are unknown. Amount of those species that are used as bait is very small and the fishery may meet the requirement of “some quantitative information”. However, taking precautional approach, it is concluded that the fishery does not meet the SG 100 level.

|--|------|---|-----|----|
|  |      | of certainty whether the strategy is achieving its objective. |     |    |
|  | Met? | Yes   | Yes | No |

#### Rationale

There is no main Primary species in for this fishery. Only main Primary species are considered at the SG 80 level. Therefore, the SG 80 is met.

As described at SI a and b of this PI, details of stocks of sardine, mackerel and Japanese flying squid are unknown. Therefore, the SG 100 cannot be met.

| Rationale     |                                     |  |   |   |

### Sandbar shark

All sharks were released by the 6 UoA vessels in 2019. No shark retention is allowed in PNG waters, and retention of Silky shark and Oceanic Whitetip shark is prohibited by WCPFC and Japanese government. Sandbar shark are also released along with other sharks. Logbook records showed 1,301 individuals of Carcharhinus sharks were hooked and released in 2019, including Sandbar sharks, Silky sharks and Oceanic Whitetip sharks. As the sharks were released by cutting lines without landing, it is almost impossible for crews to identify species belonging to the same genus.

At this moment, we cannot estimate what percentage of the 1,301 Carcharhinus sharks are Sandbar sharks. According to FishBase, distribution of Sandbar sharks is relatively coastal, so interaction with the UoA seems limited.

Sandbar shark is classified as VU by the IUCN's Red List. 51 ton of Sandbar shark are hooked by the 4 UoA vessels and all sharks are released. Mortality is not expected to be high because they are released by cutting the line instead of being fried on deck. Therefore, SG60 is likely to be met. However, more information is needed to demonstrate the likelihood required at SG80.

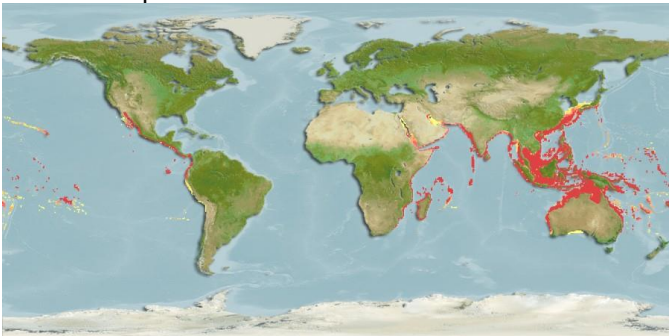

### **Blue marlin**

According to a report by National Research Institute of Far Seas Fisheries, "In 2016, The International Scientific Committee for Tuna and Tuna-like Species in the North Pacific Ocean (ISC) Billfish Working Group updated the stock assessment for this stock. The results of the stock assessment indicate that the stock is not overfished and has not reached overfished status, but is almost fully utilized. The Working Group also noted that the majority of the catch of this stock is from bycatch, making direct control of the catch difficult, so it was recommended that fishing mortality rates should not be increased from recent years' levels. The results of the stock assessment were reported at the same year's ISC plenary meeting and at the Science Committee of the WCPFC." Blue marlin accounted for 2.3 % of the fishery's catch, and it may not be classified as "major". However, it is assessed as a main Secondary species precautional, considering the fact that the catch data was only from 4 vessels out of 5 vessels. As a conclusion, the SG80 is considered met.

### **Shortfin scad**

The shortfin scad used in this fishery are mainly from China and Vietnam. The scad is distributed in the coastal area of East and South East Asia. It is listed as Least Concern on the IUCN Redlist, which means that there is no concern for resource depletion. RBF should be used in the full assessment. We give it a provisional score of 60 here.

### **Smoothbelly sardinella**

The smoothbelly sardinella appears to be caught in China's coastal waters, but no details are available. It is listed as Least Concern on the IUCN's Red List, so provisionally the score of 60 is given to the PI. RBF should be used in the full assessment. SG 80 and 100 are not met.

|           |                                      |   |           |
|-----------|--------------------------------------|---|-----------|
| <b>b</b>  | Minor secondary species stock status |   |           |
|           | Guide post                           | <p>Minor secondary species are highly likely to be above biologically based limits.</p> <p>OR</p> <p>If below biologically based limits', there is evidence that the UoA does not hinder the recovery and rebuilding of secondary species</p> |           |
|           | Met?                                 |   | <b>No</b> |
| Rationale |                                      |   |           |

### **Sharks**

Thresher sharks and Hummer head sharks are hooked and classified as minor Secondary species. All sharks that are hooked are released. However, post-release mortality is unknown. Therefore, the SG 100 is not met.

### **Bait fish**

Blackear sardine, Mackerel scad, Argentine shortfin squid and milkfish are used as bait and classified as minor Primary species, but details are not known. Therefore, the SG 100 is not met.

| <b>a</b>      | Management strategy in place |  |   |  |
|               | Guide post                   | There are <b>measures</b> in place, if necessary, which are expected to maintain or not hinder rebuilding of main secondary species at/to levels which are highly likely to be above biologically based limits or to ensure that the UoA does not hinder their recovery. | There is a <b>partial strategy</b> in place, if necessary, for the UoA that is expected to maintain or not hinder rebuilding of main secondary species at/to levels which are highly likely to be above biologically based limits or to ensure that the UoA does not hinder their recovery. | There is a <b>strategy</b> in place for the UoA for managing main and minor secondary species. |
|               | Met?                         | <b>Yes</b>   | <b>No</b>   | <b>No</b>  |
| Rationale     |                              |  |   |  |

### Black marlin

FRA noted about Black marlin that “the majority of the catch of this stock is from bycatch, making direct control of the catch difficult, so it was recommended that fishing mortality rates should not be increased from recent years' levels”. As for Japan's pelagic longline vessels, the Japanese government has a policy not to increase fishing pressure by increasing the number of vessels. That may have indirectly led to not increasing fishing pressure on black marlin. SG60 is likely to be met. However, more species-specific management measures is needed to meet SG 80 and SG 100.

### Bill fish

Other bill fish species are categorized as “minor” and only assessed at SG 100 level. As for Japan's pelagic longline vessels, the Japanese government has a policy not to increase fishing pressure by increasing the number of vessels. That may have indirectly led to not increasing fishing pressure on black marlin. SG60 is likely to be met. However, more species-specific management measures is needed to meet SG 100.

### Sandbar shark

All shark species are released. This is considered as a “measure” required at SG 60. However, it would not be a “partial strategy” required by SG 80.

### Other sharks

Other sharks are categorized as “minor” Secondary species and only assessed at SG 100 level. All shark species have been released. However, mortality rates are unknown and no measures have been established. Therefore, SG 100 is not met.

### Shortfin scad and Smoothbelly sardinella

The UoA fishery uses a variety of fish species as bait, and as a result, there seems no overloading of any one species. Bait fishery in China and Vietnam are regulated by fishery closure period, May to July in China and October to March in Vietnam. They are considered “measures” required by SG 60. However, it does not appear to meet the requirements of SG 80 and SG 100 because the details of the fish species/stock are unknown. In order to achieve higher scores, information on species and stocks and how they are managed in the bait fishery is required.

### Other bait fish

Other bait species are categorized as “minor” and only assessed at SG100. Details of stocks of those species are unknown, so the SG 100 is not met.

|          |                                |  |   |  |
|----------|--------------------------------|--|---|--|
| <b>b</b> | Management strategy evaluation |  |   |  |
|          | Guide post                     | The measures are considered <b>likely</b> to work, based on plausible argument (e.g. | There is <b>some objective basis for confidence</b> that the measures/partial strategy will | <b>Testing</b> supports <b>high confidence</b> that the partial strategy/strategy will work, |

|           |      |  |   |  |
|-----------|------|--|---|--|
|           |      | general experience, theory or comparison with similar UoAs/species). | work, based on some information directly about the UoA and/or species involved. | based on information directly about the UoA and/or species involved. |
|           | Met? | <b>Billfish : Yes</b><br><b>Sharks : Yes</b><br><b>Baitfish : No</b> | <b>No</b>   | <b>No</b>  |
| Rationale |      |  |   |  |

#### Bill fish

The measure of not increasing fishing pressure by not increasing the number of Japanese fishing vessels seems working to some extent, and it appears that SG60 is met. However, SG 80 is not met as no further controls are in place.

#### Sharks

Japan's National Plan of Action for Conservation and Management of Sharks National Action is regularly reviewed and impact of Japanese longline fishing vessels against sharks are annually reported to WCPFC. The measure of releasing all sharks into the water appears to be working to some extent and is likely to meet SG60. However, it is unlikely that SG 80 will be met due to unknown mortality rates after release.

#### Bait fish

There is limited information on bait fishery in China and Vietnam that catch shortfin scad and smoothbelly sardinella. Stock status of those species are not assessed. It is also unclear what measures are being taken in the bait fishery, except seasonal fishery closure, and how those measures work is unknown. In addition, even if the bait selection of Japanese fishing vessels is one of the measures, it is unclear whether the measures are working or not. Therefore, SG60 is not considered to be met.

|           |                                    |  |   |   |

|           | Guide post                         |  | There is <b>some evidence</b> that the measures/partial strategy is being <b>implemented successfully</b> . | There is <b>clear evidence</b> that the partial strategy/strategy is being <b>implemented successfully and is achieving its objective as set out in scoring issue (a)</b> . |
|           | Met?                               |  | カジキ類 : <b>Yes</b><br>サメ類 : <b>Yes</b><br>餌魚 : <b>No</b>   | <b>No</b>   |
| Rationale |                                    |  |   |   |

#### Bill fish

The Japanese government's management policy of not increasing the number of Japanese pelagic longline fishing vessels is clearly being implemented and appears to meet SG80. However, as the policy is not considered to a strategy/partial strategy to manage specific species, the SG 100 is not met.

#### Sharks

All sharks are released, which has been confirmed by observers and at the time of landing, SG80 is likely to be met. However, as observer data is not reviewed yet, SG100 cannot be met at this stage.

#### Bait fish

There is no information at all about the fisheries that catch bait fish. Therefore, it is not clear what management practices are in place. The SG 80 is not met.

|          |               |   |  |  |
|----------|---------------|---|--|--|
| <b>d</b> | Shark finning |   |  |  |
|          | Guide post    | It is <b>likely</b> that shark finning is not taking place. | It is <b>highly likely</b> that shark finning is not taking place. | There is a <b>high degree of certainty</b> that shark finning is not taking place. |

|-----------|------|-----|----|----|
|           | Met? | Yes | No | No |
| Rationale |      |     |    |    |

According to the logbook, all sharks are released. Since 2008, all parts of sharks are required to be retained by national regulations, except for the head and guts. The fact that no body parts of sharks are landed is confirmed by the Fisheries Agency at the time of landing, such as in Yaizu. At the time of transshipment at sea, WCPFC observers will be on board and inspect if the vessel owns shark fins. SG60 is likely to be met. However, in order to say "highly likely" further information is required, including the observer record, market information and other relevant information.

| e         | Review of alternative measures to minimise mortality of unwanted catch |   |  |  |
|           | Guide post   | There is a review of the potential effectiveness and practicality of alternative measures to minimise UoA-related mortality of <b>unwanted</b> catch of main secondary species. | There is a <b>regular</b> review of the potential effectiveness and practicality of alternative measures to minimise UoA-related mortality of <b>unwanted</b> catch of main secondary species and they are implemented as appropriate. | There is a <b>biennial</b> review of the potential effectiveness and practicality of alternative measures to minimise UoA-related mortality of <b>unwanted</b> catch of all secondary species, and they are implemented, as appropriate. |
|           | Met?   | <b>Blue marlin : No</b><br><b>Sandbar shark : No</b>  | <b>No</b>  | <b>No</b>  |
| Rationale |  |   |  |  |

#### Blue marlin

600kg of blue marlin have been released and discarded within the UoA in 2019, which is considered as "unwanted catch". It is unknown why these are being released and discarded. Alternative measures to reduce the unwanted catch of blue marlin are not known. The SG60 is not likely to be met.

#### Sandbar shark

Logbook records showed 1,301 individuals of Carcharhinus sharks were hooked and released in 2019, but percentage of Sandbar shark is unknown. If certain amount of Sandbar shark is hooked, it should be considered as "unwanted catch". Alternative measures to reduce the catch of Sandbar sharks are unknown and SG 60 is not likely to be met.

| Rationale     |  |  |   |   |

### Blue marlin

The catch of blue marlin is documented in logbook and supported by landings data. Blue marlin are subject to stock assessment. The SG 60 and SG 80 are considered to be met.

### Sandbar sharks

The catches of sandbar sharks are recorded in the logbook, but there are likely to be some inaccuracies. Although the catches of sharks by Japanese longline vessels are reported in the annual reports to the WCPFC, sandbar sharks are grouped together as "sharks" and there is no information specific to the fish species. Mortality rates are also unknown. Therefore, it does not appear to meet SG 60.

### Amberstripe scad and smoothbelly sardinella

Little information is available on the biology and fisheries of the scad and sardinella used as bait, therefore, the SG 60 is not likely to be met.

|           | Guide post  | Some quantitative information is adequate to estimate the impact of the UoA on minor secondary species with respect to status. |  |           |
|           | Met?  |  |  | <b>No</b> |
| Rationale |   |  |  |           |

### Bill fish

The catches from this fishery are captured through catch reports and landings data. Many swordfish species are subject to stock assessment. Therefore, the "Some quantitative information" required by SG100 It is likely to satisfy the

### Sharks

There are likely to be some inaccuracies in the catch performance reports for sharks. Therefore, SG 100 will not be met.

### **Baitfish**

There is little information on the fisheries that catch bait fish. Therefore, SG 100 is not met.

| <b>C</b>  | Information adequacy for management strategy |   |   |  |
|-----------|--|---|---|--|
|           | Guide post                                   | Information is adequate to support <b>measures</b> to manage <b>main</b> secondary species. | Information is adequate to support a <b>partial strategy</b> to manage <b>main</b> secondary species. | Information is adequate to support a <b>strategy</b> to manage <b>all</b> secondary species, and <b>evaluate</b> with a <b>high degree of certainty</b> whether the strategy is <b>achieving its objective</b> . |
|           | Met?   | <b>Blue marlin : Yes</b><br><b>Sandbar shark : No</b><br><b>Bait fish : No</b>              | <b>Yes / No</b>   | <b>Yes / No</b>  |
| Rationale |  |   |   |  |

### **Blue marlin**

Catch records of blue marlin by Japanese vessels are used for stock assessment for the WCPFC and are reflected in fisheries management. Therefore, it is likely to meet SG 60 and SG 80.

### **Sandbar shark**

There appears to be some inaccuracies in the records of sharks in the logbook. Observer records of catch of sandbar sharks are considered reflected to the stock assessment, but it is not clear. As a precaution, we assume that SG 60 is not met.

### **Amberstripe scad and smoothbelly sardinella**

No information is available on the fisheries that catch amberstripe scad and smoothbelly sardinella. Therefore, SG 60 is not met at this time.

| Rationale |                |  |  |  |

### **Oceanic whitetip shark and Silky shark**

All sharks including oceanic whitetip sharks and silky sharks are released, so it is considered that the UoA does not hinder recovery of those species. The SG 60 is likely met. However, as the mortality rate is unknown and there are likely to be inaccuracies in the logbook, it does not meet the likelihood required at SG 80 and SG 100.

### **Sea bird**

According to the annual report submitted by the Japanese government to the WCPFC, little bycatch of seabirds in the has been observed in the FAO 71 area (23N – 25S). Therefore, it is likely that SG 60 is met. However, because of the likely inaccuracies in the logbook, the certainty required by SG 80 is not met.

Appendix Table 13-3 Number of observed seabird captures in Japan longline fisheries in the longliners larger than 20 GRT (approximately  $\geq 24\text{m}$ ), 2019, by species and area. This table was request written in paragraph 13 of CMM 2018-03.

### Sea turtles

According to the annual report submitted by the Japanese government to the WCPFC, in the FAO 71 area, little bycatch of sea turtles by “distant water and offshore longline” has been observed. Therefore, the SG60 is likely to be met. However, since there may be some inaccuracies in the logbook, the certainty required by SG80 is not considered to be met.

Table 8. Number of operations and catch number for longline observer program in the western central Pacific in 2019.

| Fishery                  | Small offshore longline | Distant water and offshore longline |

| Rationale |  |   |   |  |

### Sharks

All sharks are released. This qualifies as a "measure" required by SG 60, but may not be considered as "strategy" required at the SG 80.

### Sea birds

According to fishermen's logbook, one or more seabird bycatch avoidance measures are in place. Therefore, the SG 60 appear to be met. However, there are likely to be some inaccuracies in the logbook, so this may not be considered as "strategy" required at the SG 80.

### Sea turtles

The fishery is operating in the area where sea turtles are rare. In addition, when the turtle are hooled, it is obligatory to release it by removing the hook using a specific device. It appears to meet SG60. However, there are likely to be some inaccuracies in the logbook, so this may not be considered as "strategy" required at the SG 80.

|           | Met? | <b>Sharks : Yes</b><br><b>Sea birds : Yes</b><br><b>Sea Turtles : Yes</b>   | <b>Sharks : No</b><br><b>Sea birds : No</b><br><b>Sea turtles : No</b>   | <b>No</b>   |
| Rationale |      |   |  |   |

### Sharks

All sharks are released. There is information from other Japanese longline fishery that sometimes sharks with hooks are caught, which means the mortality rate of sharks after their release was not so high. The measure that all sharks are released is considered likely to work to protect shark species and the SG 60 is met. However, SG80 will not be met due to lack of objective information on mortality after release.

### Sea Bird

The fishery operates in an area where seabird bycatch is low, and it is observed and recorded through the observer program. The SG 60 is likely met. However, that is not UoA specific information. Also, there may be inaccuracies in the logbook, so the extent the UoA affects to seabirds is unclear. Therefore, SG 80 is not likely to be met.

### Sea turtles

The fishery operates in an area where sea turtle bycatch is low, and it is observed and recorded through the observer program. The SG 60 is likely met. However, that is not UoA specific information. Also, there may be inaccuracies in the logbook, so the extent the UoA affects to sea turtles is unclear. Therefore, SG 80 is not likely to be met.

|           | Management strategy implementation |  |   |   |
| <b>d</b>  | Guide post                         |  | There is some <b>evidence</b> that the measures/strategy is being implemented successfully. | There is <b>clear evidence</b> that the strategy/comprehensive strategy is being implemented successfully and <b>is achieving its objective as set out in scoring issue (a) or (b).</b> |
|           | Met?                               |  | <b>Sharks : Yes</b><br><b>Sea birds : No</b><br><b>Sea turtles : No</b>                     | <b>No</b>   |
| Rationale |                                    |  |   |   |

### Sharks

All shark species are released, which is confirmed by observer data (check required) and at the time of landing. "Some evidence" required by SG 80 is met. SG 100 is not, as observer data or other objective evidence is not available yet.

### Sea Bird

Which bycatch avoidance measures were used are described in the logbook, but objective support is not available. Therefore, SG 80 is not likely to be met.

### Sea turtles

Information about how the sea turtles were released are not available from the logbook or other sources. Therefore, SG 80 is not likely to be met.

| e         | Review of alternative measures to minimize mortality of ETP species |   |  |  |
|-----------|---|---|--|--|
|           | Guide post  | There is a review of the potential effectiveness and practicality of alternative measures to minimise UoA-related mortality of ETP species. | There is a <b>regular</b> review of the potential effectiveness and practicality of alternative measures to minimise UoA-related mortality of ETP species and they are implemented as appropriate. | There is a <b>biennial</b> review of the potential effectiveness and practicality of alternative measures to minimise UoA-related mortality ETP species, and they are implemented, as appropriate. |
|           | Met?  | <b>Yes</b>  | <b>No</b>  | <b>No</b>  |
| Rationale |   |   |  |  |

**Sharks**  
**Sea bird**  
**Sea turtle**

In each species, the WCPFC discussed and prepared CMMs (Conservation Management Measures). Therefore, SG 60 is likely to be met. More evidence should be collected, through hearing to fishery and management organizations, to confirm if those measures are "periodically" reviewed and "implemented" as required by the SG 80.

| Rationale     |  |   |  |   |

#### Sharks Sea bird Sea turtle

For both sharks, seabirds, and sea turtles, there are some inaccuracies in the logbook. Therefore, it is not possible to know directly the impact of the UoA on ETP species. Scientific observers are supposed to board the pelagic longline vessels by lottery, but the boarding rate is about 5% and it may not be sufficient to understand UoA's impact against ETP species. SG60 is not likely to be met.

|           | Guide post                                   | Information is adequate to support <b>measures</b> to manage the impacts on ETP species. | Information is adequate to measure trends and support a <b>strategy</b> to manage impacts on ETP species. | Information is adequate to support a <b>comprehensive strategy</b> to manage impacts, minimize mortality and injury of ETP species, and evaluate with a <b>high degree of certainty</b> whether a strategy is achieving its objectives. |
|           | Met?   | <b>Sharks : Yes</b><br><b>Sea birds : Yes</b><br><b>Sea turtles : Yes</b>                | <b>No</b>   | <b>No</b>   |
| Rationale |  |  |   |   |

#### Sharks

Stocks of Oceanic whitetip sharks and silky sharks have been assessed and the results are reflected to various conservation measures. The SG60 is met. However, SG 80 is not met because the "strategies" do not exist.

### Sea Birds

Various research studies are being conducted independently of fisheries to avoid seabird bycatch, and result is reflected to conservation measures. The SG 60 is met. However, SG 80 is not met because the “strategies” do not exist.

### Sea turtles

Researches on distribution, habitat, bait, and techniques for removing the hook have been conducted to mitigate sea turtle bycatch. Those researches are reflected to conservation measures. The SG60 is met. However, SG 80 is not met because the “strategies” do not exist.
