Summary

This work applies the risk assessment method known as Productivity and Susceptibility Analysis (PSA) to the fish collected in long-lines, and sometimes hand line in the Yucatan red grouper fishery. List of species include fish caught or registered by FIP members and/or fish reported by regional authors in recent research in Yucatan. In the region there are a large number of researchers who have published many of the articles reviewed. Due to the above, we consider that this is a preliminary report that must be analyzed and validated by the group of experts. This activity is planned to be carried out during the second half of 2022.

List of species included as follows:

Family name	Scientific name	Nombre común	Common name
Balistidae	<i>Balistes capriscus</i>	Escochin, Cochino Gris	Gray Triggerfish
Carangidae	<i>Seriola zonata</i>	medregal rayado, coronado	Banded rudderfish
Carangidae	<i>Trachinotus carolinus</i>	Pampano amarillo	Florida Pompano
Dasyatidae	<i>Dasyatis americana</i>	Raya grande	Southern stingray
Haemulidae	<i>Haemulon plumieri</i>	Chac-chi, boquilla	White grunt
Labridae	<i>Lachnolaimus maximus</i>	Boquinete	Hogfish
Lutjanidae	<i>Lutjanus analis</i>	Pargo criollo, pargo lunarejo	Mutton snapper
Lutjanidae	<i>Lutjanus buccanella</i>	Huachinango boca negra	Blackfin snapper
Lutjanidae	<i>Lutjanus campechanus</i>	Huachinango de castilla	Northem red snapper
Lutjanidae	<i>Lutjanus cyanopterus</i>	Pargo Cubera	Cubera Snapper
Lutjanidae	<i>Lutjanus griseus</i>	Pargo mulato, pargo gris	Grey Snapper
Lutjanidae	<i>Lutjanus jocu</i>	Pargo perro, cabellera	Dog snapper
Lutjanidae	<i>Lutjanus synagris</i>	Rubia, villajaiba	Lane Snapper
Lutjanidae	<i>Lutjanus vivanus</i>	Huachinango ojo amarillo	Silk snapper
Lutjanidae	<i>Orthopristis chrysoptera</i>	Rubia, canane	Yellowwtail snapper
Lutjanidae	<i>Rhomboplites aurorubens</i>	Besugo	Vermilion snapper
Malacanthidae	<i>Lopholatilus chamaeleonticeps</i>	Corvinato	Great northem tilefish
Rachycentrid	<i>Rachycentrum canadum</i>	Esmedregal	Cobia
Serranidae	<i>Cephalopholis cruentata</i>	Cabrilla o cherna enjambre	Graysby
Serranidae	<i>Cephalopholis fulva</i>	Mero payaso, cabrilla roja,	Coney
Serranidae	<i>Dematolepis inermis</i>	Mero mármol	Marbled grouper
Serranidae	<i>Epinephelus adscensionis</i>	Cabrilla, payaso verde	Rock hind
Serranidae	<i>Epinephelus drummondhayi</i>	Speckled Hind	Lenteja abadejo Speckled
Serranidae	<i>Epinephelus guttatus</i>	Red Hind	Mero colorado Red hind
Serranidae	<i>Epinephelus itajara</i>	Cherna	Atlantic goliath grouper
Serranidae	<i>Epinephelus mystacinus</i>	Mero listado	Misty grouper
Serranidae	<i>Epinephelus striatus</i>	Mero del caribe, cherna	Nassau grouper
Serranidae	<i>Hyporthodus flavolimbatus</i> (an)	Mero negro, fiat	Yellowedge grouper
Serranidae	<i>Hyporthodus nigritus</i> (antes E.)	Cherna pintada	Warsaw grouper
Serranidae	<i>Hyporthodus niveatus</i> (antes E.)	Corvinato	Snowy grouper
Serranidae	<i>Mycteroperca interstitialis</i>	Gallina, mero boca amarilla	Yellowmouth grouper
Serranidae	<i>Mycteroperca microlepis</i>	Abadejo, Gag	Gag
Serranidae	<i>Mycteroperca phenax</i>	Cabrilla , negrillo, abadejo	Scamp
Serranidae	<i>Mycteroperca tigris</i>	Cuna gata o vampiro	Tiger grouper
Serranidae	<i>Mycteroperca venenosa</i>	Guacamayo, arigua	Yellowfin grouper
Sparidae	<i>Calamus bajonado</i>	Mojarron	Jolthead Porgy
Sparidae	<i>Calamus calamus</i>	Pluma calamo	Saucereye Porgy
Sparidae	<i>Calamus campechanus</i>	Cachipluma	Campeche Porgy
Sparidae	<i>Calamus nodosus</i>	Mojarra, pluma, cachipluma	Knobbed Porgy
Carcharhidae	<i>Carcharhinus acronotus</i>	Cazón	Blacknose shark
Sphyrnidae	<i>Sphyrna tiburo</i>	Cornuda cabeza pata	Bonnethead

Acronyms

ERAEF	Environmental Risk Assessment for the Effects of Fishing
GMFMC	Gulf of Mexico Fishery Management Council
MSC	Marine Stewardship Council
PSA	Productivity-Susceptibility Analysis
RBF	Risk-Based Framework

Introduction

Productivity-Susceptibility Analysis (PSA) is a semi-quantitative method used to assess the vulnerability of species associated within data deficient fisheries. The method has been refined by the Commonwealth Scientific and Industrial Research Organization (CSIRO) of Australia, based on the method developed by Stobutzki et al. (2001) to evaluate the probability of sustainability of the species of the companion fauna in a fishery. The PSA is part of a broader hierarchical methodology developed by CSIRO, called the Environmental Risk Assessment for the Effects of Fishing (ERAEF), which can be applied to species, habitats or communities with low fishing impact (Hobday et al., 2004; Hobday et al., 2007) and has been used to assess all fisheries managed by the Australian Fisheries Management Authority (Smith et al., 2007) and it is part of the Marine Stewardship Council (MSC) framework.

Data

A preliminary list of species that have appeared within longline used in the fishery was made in the samplings carried out between 2017 and 2021. The data was gathered by fisherman, or at the reception center of FIP members. All the fish that is caught and taken to the reception areas is sold, to the processors or to small local restaurants or used as bait A total of 43 species were identified as secondary species.

Methodology

In order to determine the risk level for each species, a bibliographic search was carried out in order to get the information available on the species in the region. When species-specific information was not available, information from similar species within the same genus or family was used. When this was not possible, a precautionary approach was considered by assigning the highest risk value.

Productivity and Susceptibility attributes were scored based in tables 1 & 2, and on the information gathered. Trophic level attributes were obtained from Fishbase (2022), or any other detailed information for the species, genus or family.

The score for each component of the PSA was recorded in the “MSC RBF Worksheet”.

The PSA (Figure 1) is based on the assumption that the potential risk of fishing to a species that is directly or indirectly impacted depends on two main components (Stobutzki et al., 2001; Stobutzki et al., 2002; Hobday et al., 2007; Patrick et al., 2010; Hobday et al., 2011; Clarke et al., 2018):

- ❖ Its natural productivity, related to the recovery capacity of the species. This attribute is associated with the biology and ecology of the species..
- ❖ Its susceptibility to being fished, which reflects how exposed it is to fishing activities. This component is related to the characteristics of both the fishing gear and the spatial distribution of the fishery in relation to its natural distribution in the area.

The potential risk associated with the productivity or susceptibility of a particular species was determined with the tools provided by MSC (v 2.1) for applying the RBF.

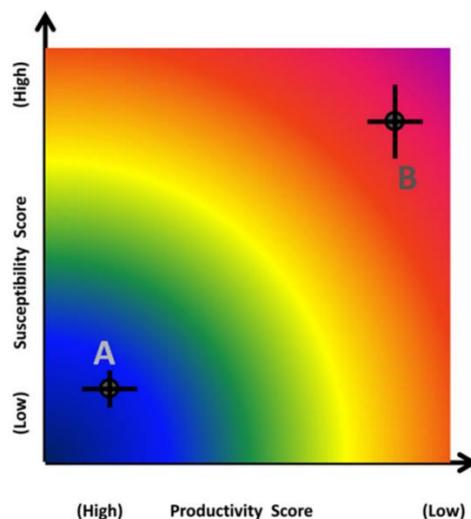

Figure 1. PSA graph with productivity and susceptibility axes, and the risk space divided into regions. If the vulnerability is <1.80, the risk is low; if the vulnerability is between 1.80 and 2.20, the risk is medium; and if the vulnerability is > 2.20, the risk is high. The graph has been modified from Stobutzki et al. (2001b), inverting the productivity scale that starts with 3 (high productivity) instead of 1 (low productivity).

The PSA considers eight productivity attributes: average age at maturity, average size at maturity, average maximum age, average maximum size, fecundity, reproductive strategy, trophic level and density dependence (only for invertebrates). The average maximum age and average maximum size are not used for the evaluation of invertebrates. For each of these attributes there are ranges associated with different levels of productivity as presented in Table 1. If the level of productivity associated with the attribute is high, a score of 1 (low risk) is given; if it is medium, 2 (medium risk); and if it is low, 3 (high risk).

Table 1. PSA productivity attributes and scores (from MSC V 2.0)

Productivity attribute	High productivity (Low risk, score = 1)	Medium productivity (medium risk, score = 2)	Low productivity (high risk, score = 3)
Average age at maturity	<5 years	5-15 years	>15 years
Average maximum age	<10 years	10-25 years	>25 years
Fecundity	>20,000 eggs per year	100-20,000 eggs per year	<100 eggs per year
Average maximum size (not to be used when scoring invertebrate species)	<100 cm	100-300 cm	>300 cm
Average size at maturity (not to be used when scoring invertebrate species)	<40 cm	40-200 cm	>200 cm
Reproductive strategy	Broadcast spawner	Demersal egg layer	Live bearer
Trophic Level	<2.75	2.75-3.25	>3.25
Density dependence !! (to be used when scoring invertebrate species only)	Compensatory dynamics at low population size demonstrated or likely.	No compensatory or compensatory dynamics demonstrated or likely.	Depensatory dynamics at low population sizes (Allee effects) demonstrated or likely.

In the case of susceptibility, there are four attributes: availability, which refers to the portion of the horizontal distribution of the species that coincides with the areas in which the fishery takes place; encounterability, which refers to the vertical overlap between the usual position of the fishing gear and the species in the water column; selectivity of fishing gear, and post-capture mortality (Hobday, 2007; Smith et al., 2007). Selectivity of the fishing gear is evaluated based on two criteria: the relationship between the size of immature individuals and the probability of their capture; and the possibility that these immature individuals may escape the fishing gear alive or may evade it.

Each attribute receives a score of 1, 2, or 3, depending on whether it is associated with low (low risk), medium (medium risk), or high (high risk) susceptibility, in accordance to criteria shown in the Table 2.

TABLE 2. Susceptibility attributes (MSC version 2.1)

Susceptibility attribute	High productivity (Low risk, score = 1)	Medium productivity (medium risk, score = 2)	Low productivity (high risk, score = 3)
Areal overlap (availability) Overlap of the fishing effort with a species concentration of the stock	<10% overlap	10-30% overlap	>30% overlap
Encounterability The position of the stock/species within the water column relative to the fishing gear, and the position of the stock/species within the habitat relative to the position of the gear	Low overlap with fishing gear (low encounterability).	Medium overlap with fishing gear.	High overlap with fishing gear (high encounterability). Default score for target species (Principle 1).
Selectivity of gear type Potential of the gear to retain species	a Individuals < size at maturity are rarely caught. b Individuals < size at maturity can escape or avoid gear.	a Individuals < size at maturity are regularly caught. b Individuals < half the size at maturity can escape or avoid gear.	a Individuals < size at maturity are frequently caught. b Individuals < half the size at maturity are retained by gear.
Post-capture mortality (PCM) The chance that, if captured, a species would be released and that it would be in a condition permitting subsequent survival	Evidence of majority released post-capture and survival.	Evidence of some released post-capture and survival.	Retained species or majority dead when released. Default score for retained species (Principle 1 or Principle 2).

Results and Discussion

Specific information for each species, references and information of each score is in preparation. Most of the scores were evaluated from bibliographic information. In some cases where specific information was not found, genus or family information was taken into consideration as reference. Fish trophic level was taken from Fishbase in all cases (Froese & Pauly, 2019). Precautionary scores were considered in the Susceptibility attribute. The following tables show some of the information gathered and considerations taken.

Family name	Scientific name	Nombre común	Common name	Snapper target species, CNP 2018	Especies Comerciales de la pesca artesanal PY Ramos-Miranda, et al. 2021	CNP 2018 Grouper fishery	NOM 065 grouper fishery	Average age at maturity	Average max	Fecundity

Conclusions

Considering a precautionary approach, the fishery **would not pass Performance Indicator 2.2.1**. Through the Biological Monitoring Program 36 of the 41 species listed were identified at least once. In recent years, The FIP has reduced the amount of catch and over the years the associated species have changed depending on the catch objective of each fisherman.

This report attempts to include information on the species ever captured or recorded in order to have base information from which to start and detect the species at greatest risk. As more information is generated and gathered, these results may vary. **The Productivity Susceptibility Analysis results show seven species at low risk score, one of them, the *Carcharhinus acronotus* score <60 posing a high risk, and 28 species poses medium risk (60-79), thus the Performance Indicator 2.2.1.** of the MSC standard would fail.

The complexity of this fishery makes it necessary for these results to be completed and validated by both expert researchers and fishermen, an activity planned for the second half of 2022.
